

BitNet Services

Xero

Integrations - A case
Study

01st August, 2021

Xero APIs

- Xero API exposes various Xero entities to work with.
- They are secured with and they can be integrated with secured app using client id and secret
- They recently migrated to OAuth2.0 to further strengthen their integration

Our Experience with Xero API integration

- BitNet Services has vast integration experience using industry standards with various tools
- Working with Xero API has been both fun and challenging using OAuth.
- Data Factory is primary tool used to integrate when it is on cloud.

Implementation Experience

- **Disability Services Australia**, a Visicase Australia client to share employee and payroll details to Xero. This will allow DSA to run payrolls in Xero.
The Challenge BNS overcome was to integrate with legacy application running on php environment
- **Drivatic.com** managing their SaaS application and allowing their tenants to integrate with Xero and push their app data into Xero for Payroll. This includes tracking options, Leave Types, Leaves, and Employees.
The Challenge BNS overcome to connect each separate integration app to and manage data isolation at tenant level.
- **Cloud Edge** - To migrate existing applications from OAuth 1.0 to OAuth 2.0 and enhancements like Push/Pull Invoicing API.
